

The five steps to create a Comprehensive Security Ecosystem

Take Inventory

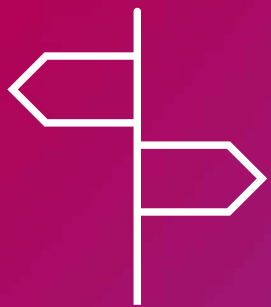

Assess which security solutions are currently in place, how data is shared across systems and what gaps currently exist.

STEP 1

STEP 2

Set Goals

Potential goals may include a decrease in cybersecurity incidents, an increase in patching cadence, or better results in phishing tests.

Assess Solutions

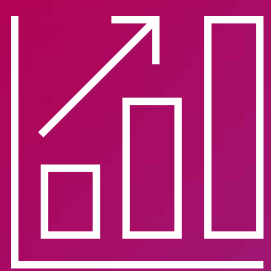

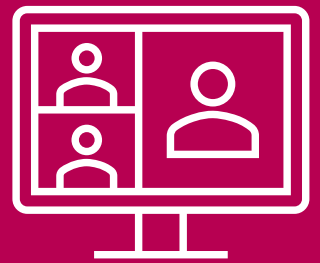

It is important to spend time researching to find solutions that strike a balance between being cost effective and feature-rich.

STEP 3

STEP 4

Implement Solutions

It may be beneficial to set up Microsoft Intune first, then use the MDM functionality to implement additional services and solutions.

Monitor and Evaluate

This will ensure that everything is working as intended, and provide a view of any threats that the systems have identified or mitigated.
